SOP-IT-002 · Reading room and helper access: nothing to sign up for, and a room kept ready

SOP IT-002 | Status draft | Changed 2026-11-01 | For The shop and its helpers

Department: IT · **ID:** 002 · **Status:** draft (approved when tagged) · **Owner:** the lab · **Last changed:** 2026-11-01

Purpose

How the shop (and anyone helping the shop, a person or an AI assistant) reads everything that was made for it, with the smallest possible access: today, none at all.

Scope

The two websites, their public source, the slides, and the private drafts written for the shop (proposals and these procedures). Never passwords, store logins, payment details or anything from the shop's own accounts.

Roles

Role	Does
The shop	opens links; asks Kenney for anything else
The shop's helper (an employee, a web person, an AI assistant)	reads what is public; asks through Kenney for the rest; never receives a password
Kenney	passes PDFs and links
The lab	sends PDFs; opens a door (below) only if the shop asks for one

Steps: read, with no account

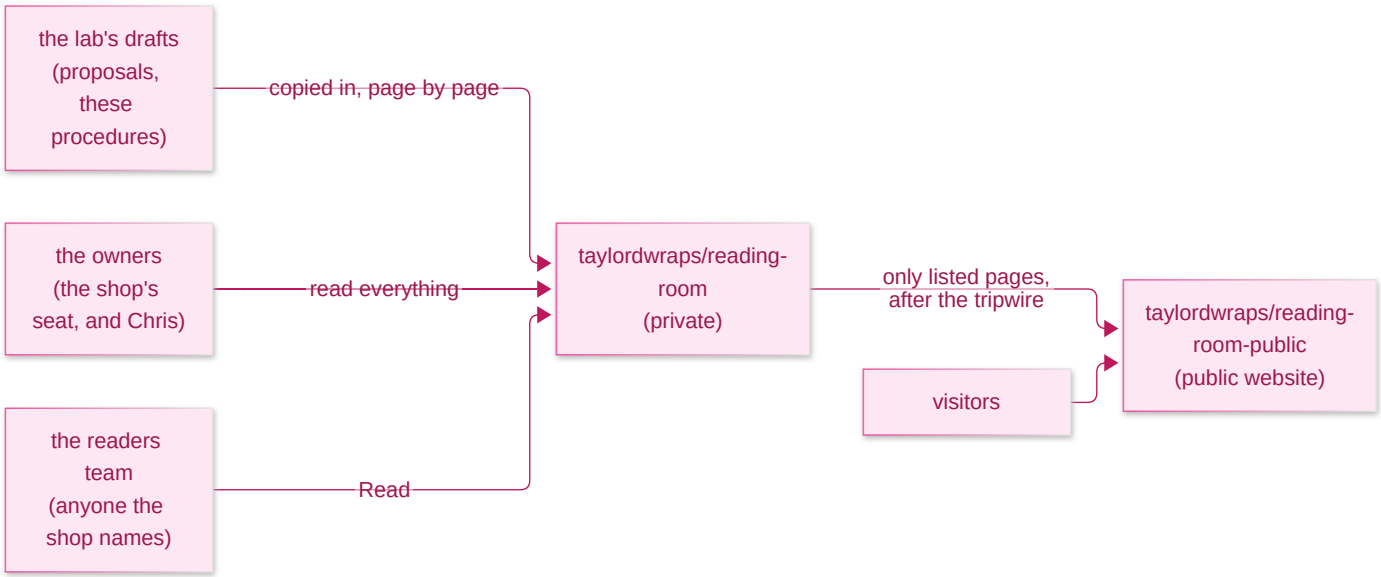

1. **The websites:** open https://drasticstatic.github.io/taylordwraps-nextjs-preview/ (THE CARPORT) and https://drasticstatic.github.io/taylordwraps-public-preview/ (THE CAR SHOW) on any phone or computer. *You should see:* the website; no sign-in is ever asked for.
2. **The slides:** https://drasticstatic.github.io/taylordwraps-public-preview/decks/hello-taylor.marp.html (arrow keys or swipe), or the PDF beside it. *You should see:* "Hello, Taylor".
3. **The private drafts** (the proposals, these procedures) arrive as **PDFs through Kenney**. *You should see:* a PDF you can open, print or forward. Nobody needs an account to read them.
4. **The public source** of each website is readable by anyone at `github.com/drasticstatic/taylordwraps-nextjs-preview` and `github.com/drasticstatic/taylordwraps-public-preview`. Ideas and issues are welcome there; changes still go through Kenney (SOP-OPS-001).

Steps: bring a helper

1. **A person helping the shop** reads the same links. If they want to suggest a change, the message goes to Kenney like any other request. *You should see:* no access granted to anyone, and nothing missing.
2. **An AI assistant** can read the websites, the public repositories and any PDF it is given, with no credential. Ask it to summarise one page without changing anything. *You should see:* a correct summary.
3. **Never give a helper a password,** a store login, or a code sent by text. Nothing here needs one.

The reading room, kept ready

The workshop is a private repository in Chris's personal GitHub account. GitHub cannot give anyone *read-only* access to a personal private repository (an invitation for read access fails with error 422), so the lab will not "share the repository". The door is the shop's own organisation instead, `taylordwraps`, which holds a **reading room**: a private room for the shop's chosen people, and a public room beside it for what is ready for visitors. It is set up and waiting; nothing in it needs the shop until the shop wants it, and PDFs through Kenney keep working either way.

Piece	What it is	Address
Private room	`taylordwraps/reading-room`: the drafts written for the shop, each a page with its PDF; its README is the index	`https://github.com/taylordwraps/reading-room`
Readers team	`taylordwraps/readers`, a closed team with **Read** on the private room and nothing else	`https://github.com/orgs/taylordwraps/teams/readers`
Public room	`taylordwraps/reading-room-public`: only the pages listed in the private room's `PUBLIC-ALLOWLIST.txt`, with a front page on GitHub Pages	`https://taylordwraps.github.io/reading-room-public/`
Owners	the people who can change anything in the organisation: **two or more**, so no single person is ever the only way in	the organisation's **People** page

Why the shop's seat is an owner's. If only one person (Chris) could open the shop's GitHub home, the shop would depend on him for its own pages. With the shop as an owner too, either can invite, remove, or carry on alone, and the organisation outlives any one person's account (SOP-GOV-002).

Steps: the day the shop wants to read in a browser

1. **Your own account, first.** SOP-COM-001 is the whole first hour: you type your own password, turn on two-factor sign-in, and send only your username. *You should see:* your empty dashboard.
2. **Accept the invitation** (email, or the bell icon). *You should see:* Taylor'd Wraps under your profile's Organizations.
3. **Open the room:** `https://github.com/taylordwraps/reading-room` while signed in. *You should see:* its index, not a 404. A 404 means signed out, or the invitation still waiting.

4. **Read in the browser,** or open a PDF from the `pdf/` folder beside each page.

Steps: a helper that reads the private room with you

1. Ask whether the helper already has an approved GitHub connection that reaches the room. *If yes:* stop here.
2. If a key is needed, create a **fine-grained personal access token** in your own account: resource owner `taylordwraps`; only `reading-room`; **Contents: Read-only**; a short expiry. *You should see:* the token once; paste it only into the helper's own credential store, never into a chat.
3. Ask the helper to read one named page and summarise it without changing anything. *You should see:* a correct summary and no commit.
4. Revoke the token when the purpose ends, a device is lost, or exposure is suspected (Settings → Developer settings → Personal access tokens).

Steps: the steward (Chris, once)

```
gh repo create taylordwraps/reading-room --private        # and reading-room-public --public
gh api -X POST orgs/taylordwraps/teams -f name=readers -f privacy=closed
gh api -X PUT orgs/taylordwraps/teams/readers/repos/taylordwraps/reading-room -f permission=pull
gh api -X PUT orgs/taylordwraps/memberships/<login> -f role=admin    # an owner's seat, sent to a username the shop chose
```

You should see: the invitation waiting on the organisation's **People** page; `gh api orgs/taylordwraps --jq .default_repository_permission` prints `none` (set on 2026-11-01).

Verification

The shop and its helper open every public link above without signing in; the PDFs open; no credential was created or shared. Once the shop has a seat: the private room opens from the shop's own account, and a helper's read test passes.

Troubleshooting

Symptom	Likely cause	What to do
A link shows "404"	the link points at the private workshop (`github.com/drasticstatic/taylordwraps/…`), not a public copy	ask Kenney for the PDF instead; the lab sends public links only
The website looks out of date	the browser cached the page	reload with the cache cleared; the live copy updates within minutes of a change
Someone asks the shop for a login "to update the site"	not the lab; the lab never needs one	say no; tell Kenney
`github.com/taylordwraps/reading-room` shows 404	signed out, a different account, or the invitation not yet accepted	sign in; accept the invitation; tell Kenney or Chris the username you used
A helper's token reaches public repositories only	the token is still pending an owner's approval	an owner approves it under the organisation's personal access tokens

Change log

Date	Change	By
2026-10-31	Drafted for the shop from the universal SOP-IT-002: read with no account, PDFs through Kenney, helpers without credentials, the reading room kept as a later door	Alfred (FortunaTradesARB session)
2026-11-01	Moved into `taylordwraps/ops-standard-operating-procedures`. The reading room is kept ready in the shop's own organisation: the route in Mermaid, the address table, the shop's seat as an owner (no single point of failure), a helper's read-only key, the steward's commands	Alfred

Part of the fleet's procedures. The master copies and the legend live in my-template.
